GOOGLE AI PROGRAMME | PITCH DECK

Ledger Atlas

Price the bank before you price the deal.

AI-powered bank intelligence that scores multinational and regional banks on profitability, capital strength, cost efficiency and forecast earnings, so cross-border investors know where to negotiate and where to walk away.

Live prototype: https://invest-sight.base44.app

The Problem

Cross-border bank deals are priced blind

- Investors and corporates negotiating with banks face dozens of balance sheets across regions, each reported differently.
- Key signals (return on equity, CET1 capital, cost-income, NPLs, forecast earnings) sit in separate filings and spreadsheets.
- Analysts spend days comparing banks manually, and a weak counterparty is often spotted too late.
- Multinational and regional banks behave very differently, yet are rarely compared on one scale.

42
banks across 5 regions

$56.6T
assets in the dataset

13 of 42
balance sheets flagged as loss risk

11.3%
median ROE, wide spread underneath

Figures from the Ledger Atlas FY2025 modelled dataset.

The Proposed Solution

One screen that turns raw balance sheets into a clear decision: negotiate, monitor or walk away.

Ledger score (0-100)

Every bank is scored on profitability, capital strength, cost efficiency and forecast earnings, so any two banks can be compared instantly.

Decision tiers

Banks are sorted into Negotiation target (10), Hold & monitor (19) and Loss risk (13), turning analysis into action.

Screener + Geography + Geography

Filter and rank banks by any metric, and see regional concentration of strength and stress on an interactive map.

AI analyst

Ask questions in plain language, such as 'which Indian banks have CET1 above 16%?', and get grounded, sourced answers.

HOW IT ADDRESSES THE PROBLEM

Days of manual comparison become seconds. Investors open negotiations from a position of strength with banks such as Saudi National Bank (score 91) or ICICI Bank (88), and reprice or exit exposure to stressed balance sheets such as Deutsche Bank or Truist before the risk lands on them.

Working Prototype

Live today at invest-sight.base44.app

- Overview dashboard with portfolio signal and median score of 51/100
- Screener to rank and filter all 42 banks
- Geography map across 5 regions
- AI analyst for natural-language questions
- Per-bank analysis pages with ROE, CET1, forecast net income and a written rationale
- Multinational vs regional comparison on ROE, cost-income, CET1, NPLs and score

Multinational vs regional

Metric	Multinational (29)	Regional (13)
Assets	$52.70T	$3.85T
Median ROE	13.0%	11.0%
Cost-income	52%	58%
CET1 ratio	13.8%	11.4%
Gross NPLs	1.2%	0.9%
Forecast NI	+4.0%	+3.0%
Ledger score	54	46

Modelled FY2025 dataset. Not investment advice.

Solution Architecture

Flow

1. User opens the app and screens banks.
2. Scoring engine computes the Ledger score from stored metrics.
3. User asks the AI analyst a question.
4. Orchestrator calls skills over the dataset.
5. Gemini explains the result in plain language.

04 USED OR PLANNED

Google AI Tools

Google AI Studio

PLANNED

- Prototype and test the analyst prompts and grounding instructions.
- Tune system prompts for consistent, sourced bank analysis.
- Generate Gemini API keys and endpoints for the app backend.

Google Antigravity

PLANNED

- Agent-first IDE to build and extend the Ledger Atlas codebase.
- Agents write and test new screener filters and score logic.
- Speeds up adding new regions and datasets.

Google Agent Skills

PLANNED

- Package repeatable analyst tasks as skills: screen, compare, explain, flag risk.
- Skills keep the AI analyst consistent and auditable.
- Easy to add new skills as the product grows.

Google AI Models

Gemini model family

- Gemini Pro-class model: deep reasoning for bank-level analysis, cross-bank comparisons and risk explanations.
- Gemini Flash-class model: fast responses for screener queries and chat in the AI analyst.
- Function calling lets Gemini call scoring and screening skills instead of guessing numbers.
- Structured JSON output feeds scores, tiers and rationale straight into the UI.

Why Gemini fits

- Long context: reads many balance sheets at once for peer comparison.
- Grounded answers: responses cite dataset figures, such as CET1 19.0% or ROE 20.0%.
- Low latency and cost with Flash for everyday queries.
- Single Google stack from prototype (AI Studio) to build (Antigravity) to production.

Impact and Roadmap

Who benefits

- Cross-border investors and funds sizing counterparties.
- Corporate treasurers choosing banking partners.
- M&A and credit analysts screening targets.
- Advisors who need fast, explainable bank comparisons.

Roadmap

- **Now** — Working prototype with 42 banks, 5 regions and AI analyst
- **Next** — Gemini-powered agent with Agent Skills and function calling
- **Then** — Live regulatory filings and earnings feeds, alerts on score changes
- **Later** — Portfolio-level exposure view and many more markets
